### OWNER

Village of Crete, Illinois

GEOCON provided field Quality Control services to Iroquois Paving Corporation for the IL Route 394 project. This project consisted of a 6-mile (24 lane miles) Hot-Mix-Asphalt (HMA) patching and resurfacing project. GEOCON was responsible for monitoring rolling patterns and making on-the-fly adjustments to those patterns when density test results demanded. This project was operated under the Illinois Department of Transportation's (IDOT's) Pay For Performance (PFP) Specification, a rigorous quality control specification that requires constant testing and verification of the HMA production, placement and compaction process. Compaction efforts are verified through the testing of core samples of the HMA layer. GEOCON provided HMA sample coring services and obtained nearly 1,000 samples throughout the length of the project in 2013.
